TITLE OF INVENTION: IDENTIFICATION OF POLYNUCLEOTIDES AND POLYPEPTIDE FOR PREDICTING

RESULT 2 US-10-501-035-138

```
TITLE OF INVENTION: ACTIVITY OF COMPOUNDS THAT INTERACT WITH PROTEIN TYROSINE KINASES FILE REPERENCE: D0185 PCT
CURRENT APPLICATION NUMBER: US/10/501,035
CURRENT FILING DATE: 2004-07-09
PRIOR PAPLICATION NUMBER: US 60/350,061
PRIOR PAPLICATION NUMBER: US 60/350,061
PRIOR PILING DATE: 2002-01-18
NUMBER OF SEQ ID NOS: 795
SSQ ID NO 138
LENGTH: 6728
                                                                                                                                                                                                                                                                               3639
                                                                                                                                                                                                                                                                                                                                                                                    3759

Generating a secreted trimeric fusion protein by introducing into a cell a DNA construct comprising a promoter linked to a template encoding a signal peptide sequence followed by in-frame fusion to polypeptide to be trimerized.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide capable of self-trimerization which is heterologous to the
                                                                                                                                                                                                                                                                                                       protein secretion; fusion protein; protein activation; collagen I.
                                                                                                                                                                                                                                                                                      Human collagen alpha(I) C-propeptide TO construct protein.
                                                                                                                                                                                                                                                                                                                                                        1. .40

eukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of only the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor theoretically should have a much higher affinity to their ligand than their dimeric counterparts. Such rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of drug injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their naturally occurring trimeric ligands. The current sequence is that of the human collagen alpha(1) C-propebtide TO construct protein of the invention. The construct includes a partial glycine-repeat triple helical
polypeptide to be trimerized, and introducing the construct into

The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide expable of self-trimerization which is heterologous to the first polypeptide to be trimerized, and introducing the construct into a cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of culy the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much cathonally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of cuseful for generating as secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their current sequence is that of the human soluble CD4-human collagen alpha(1) C-propeptide to fusion protein (SD4-TO) of the invention. The collagen To construct includes a partial

```
Human alkaline phosphatase-collagen alpha(I) C-propeptide fusion protein.
                                                                                                                                                                                                                                                                 Generating a secreted trimeric fusion protein by introducing into a cell a DNA construct comprising a promoter linked to a template encoding a signal peptide sequence followed by in-frame fusion to polypeptide to be trimerized.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 propeptide TO fusion protein (AP-TO) of the invention. The collagen TO construct includes a partial glycine-repeat triple helical region.
                                                                                                                   511. .548 // Alabel= Human collagen alpha(I) glycine repeat region

Liang P;

The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide to be trimerized, which in turn is solved in-frame to a polypeptide to be trimerized, and introducing the construct into a eukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of enly the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much Generating a secreted trimeric fusion protein by introducing into a cell a DNA construct comprising a promoter linked to a template encoding a signal peptide sequence followed by in-frame fusion to polypeptide to be trimerized. Claim 15; SEQ ID NO 10; 47pp; English. N-PSDB; AEA28576.

higher affinity to their ligand than their dimeric counterparts. Such rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of drug injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for maturally occurring trimeric ligands. The current sequence is their naturally occurring trimeric ligands. The current sequence is that of the human soluble TNF-RII-human collagen alpha(I) C-propeptide TO fusion protein (sTNF-RII-human collagen alpha(I) C-propeptide TO fusion includes a partial glycine-repeat triple helical region.

The invention relates to a novel isolated polynuclectide comprising any of the 235 nucleotide sequences described in the specification. The invention further comprises: an isolated polynucleotide encoding a polypeptide with biological activity, where the polynucleotide hybridizes to one of the 235 novel polynucleotides under stringent hybridization convel polynucleotide; an vector comprising a novel polynucleotide; an capture of a vector comprising a novel polynucleotide; and expression vector comprising the novel polynucleotide; which can be operatively associated with a regulatory sequence intermedulates capturession of the polynucleotide in the host cell; an isolated comprising the novel polynucleotide, which can be obtained associated by the novel polynucleotide, or a polynucleotide of hybridizing under stringent conditions to the novel polynucleotide; an expression of the polypeptide and a carrier; an antibody directed against the polypeptide and a carrier; an antibody directed against the polypeptide; a method for identifying a compound that binds to the polypeptide; a method for identifying a compound that binds to the polypeptide; a method for identifying a compound that binds to the polypeptide; a method for identifying a compound that binds in the comprising any of the 235 amino acid sequences described in the conficiention; and a collection of polynucleotides comprising of at least one of the polynucleotides cited above. The polypeptides and antimicrobial activities The novel polynucleotide and antimical and activities the novel polynucleotide may be used to treat attimication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1035
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1156 PEYGGOSDPADVAIQLTFLEMSTEASONITYHCKNSVAYMDQQTGNLKKALLLKGSNE 1215

New polynucleotides encoding a polypeptide with biological activity, useful for treating inflammation, leukemias, nervous system disorders, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            242
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       243 IEIRAEGNSRFTYSVTVDGCTSHTGAWGKTVIEYKTTKSSRLPIIDVAPLDVGAPDQEFG 302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disorders by gene therapy. The polypeptides and polymucleotides are useful for treating inflammation, leukaemias, nervous system disorders, or infections. This sequence represents one of the 235 novel isolated polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        976 NGLPGPIGPPGPRGRTGDAGPVGPPGPPGPPGPPGPPSAGFDFSFLPQPPGBKAHDGGRY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of the pro-alpha-1 chain of human type I procollagen. The present invention relates to antisense oligomocleotides (ASOs) and their use in inhibiting expression of type I procollagen. The ASOs comprise 18-25 nucleotides and are complementary to a specific region within the type I collagen pro-alpha-1 chain gene (see AAP90491), especially those given in AAP90492-503. They are capable of inhibiting the expression of the pro-alpha-1 chain in a cell that expresses it. The ASOs are used in a claimed method of treating, or reducing a risk of, a collagen disorders may include those caused by overproduction of collagen fibres, such as liver cirrhosis, kidney, liver and heart fibrosis, scleroderma, hypertrophic scars and keloids

The invention relates to an isolated molecule comprising an antibody variable region which specifically binds to an extracellular domain of a tumour endothelial marker (TEM) protein selected from ABB90732, ABB90740, ABB90749, ABB90750 and ABB90769. The antibodies which bind to TEM proteins have cytostatic, immunostimulant and antiangiogenic activity. They are useful for inhibiting tumour growth, necangiogenesis in subjects bearing a vascularised tumour. polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis and psoriasis. Human, mouse and rat TEM genes and the encoded proteins (ABB92075-ABB92141 and ABB90713-ABB90789) are disclosed, as are marker oligonucleotide sequences: tumour endothelial markers (TEM) ABL92046-ABL92041 and ABB92191; normal endothelial markers (NEM) ABL92042-ABL92074, and pan-endothelial markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1216 YRADDANVVRDRDLEVDTTLKSLSQQIENIRSPEGSRKNPARTCRDLKMCHSDWKSGEYW 1275

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                 The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately stringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP66596-ABP66637) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells expressing the polypeptide are useful in treating pancreatic cancer and stimulating an immune response. The polynucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and

                                                                                                                                                                                                                                                                                                                                                                                                                                          242
                                                                           The present invention relates to a novel method for the isolation of endothelial cells (ECs), and the identification of genes expressed in normal and tumour ECs. Tumour endothelial marker (TEM), normal endothelial marker (TEM), normal endothelial marker (TEM), normal polynucleotide sequences encoding them are useful for detecting, diagnosing or treating tumours as well as polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis, and psoriaais. They are also useful for inhibiting neoangiogenesis or tumour angiogenesis, for inducing an immune response to tumour endothelial cells in a patient, or for identifying candidate drugs for treating tumours. The present sequence represents a human TEM or NEM protein of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ACF12828 to ACF12947 encode the human cervical cancer marker proteins (I) agiven in ABR92047 to ABR92164. A higher level of expression of (I) than normal indicates the presence of cervical cancer. Also described: (I) a vector (II) containing (I); (2) a host cell (III) containing (I); (1); and sassessing (MI) whether a patient is afflicted with cervical cancer, comprising comparing the level of expression of a marker in a patient's sample, and the normal level of expression of the marker in a control noregression of the marker in the patient's sample is an indication that the patient safflicted with control sample is an indication that the patient is afflicted with the relative to that in the control sample is an indication that the patient is afflicted with the relative to that in the patient and in vectimes (I) has cytostatic activity, and can be used in gene therapy and in vectimes (I) is useful in detecting, characterising, preventing and treating human cervical cancers. (I) may also be used in verticus prognostic and diagnostic assays, pharmacogenomics and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NGLPGPIGPPGPRGRIGDAGPVGPPGPPGPPGPPSPAGPDPSFLPQPPQEKAHDGGRY 1215

The present invention describes a predictor set comprising a plurality of polyuucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase crivity or members of the protein tyrosine kinase cutivity or members of the protein tyrosine kinase comparations the activity of cells, comprising obtaining a sample of cells, comprising obtaining a sample of cells, comprising the activity of the cells express a plurality of markers, and determining whether the cells express a plurality of meathers, and correlating the expression of the markers to the compound's ability to correlate with compound sensitivity or resistance of cells associated with a disease state; and (3) identifying polynucleotides and correlates with a disease state; and (3) identifying polynucleotides and disease that predict compound sensitivity or resistance of cells associated with a disease state, comprising subjecting the plurality of cell innes to one or more compounds sensitivity or resistance of cells associated with a disease state, compromed sensitivity or cell innes to one or more compounds, analysing the expression pattern of the microarray. The polynucleotides and polypeptides that predict the sensitivity or censtance of cells associated with a disease state by using the expression pattern of the microarray. The polynucleotides and polypeptides are useful in predicting the cativity of compounds that interact with protein tyrosine kinase pathways. These may be used in determining drug sensitivity in patients to allow the development of individualized cancer; based on patient response at a molecular level. The present conserved the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                 protein tyrosine kinase pathway; protein tyrosine kinase; cytostatic; gene therapy; drug sensitivity; genetic profile; cancer; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynucleotides and polypeptides for predicting the activity of compounds that interact with protein tyrosine kinases and/or protein
                                                                                                                                                                                                                                                                                                             predictor set; protein tyrosine kinase activity modulator;
                                                                                                                                                                                                                                                                  Human src biomarker polypeptide SEQ ID NO:331.

The method comprises obtaining a patient sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that gene expression signature of the mRNA, and using that gene expression signature to diagnose or analyse the autoimmune disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention further comprises: a treatment of rheumatoid arthritis; identification of genes for targeting in the treatment of rheumatoid arthritis in a mammal other than a mouse; diagnosis of rheumatoid arthritis in a mammal; an array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; acreening the efficacy of a candidate drug in vitro for the treatment of collageninduced arthritis; and reducing the symptoms associated with collageninduced arthritis. The compositions of the invention have the following
                                                                                                                                                                                                activities: Immunosupressive, antirheumatic, antiarthritic, osteopathic, antigout, antinflammatory, dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease a rathritides, such as rheumatoid arthritis, lupus, ankylosing spondylitis, fibrositis, fibrositis, fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and an immune disease caused by an infectious agent. This sequence represents a protein sequence relating to the genes used in the analysis and treatment of autoimmune diseases or arthritides. Note: This sequence is not shown in the specification. It has been supplied in an electronic format from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FEYGGOGSDPADVAIQLTFLRLMSTEASONITYHCKNSVAYMDQQTGNLKKALLLKGSNE 242

                                                                                                                                                                                     The invention relates to a novel method for detecting soft tissue sarcoma
                                                                                                                                                                                            which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarched of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic sacid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma—upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                 Early detection of soft tissue sarcoma comprises determining expression
                                                                                                             of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                               1156 NGLPGPIGPPGPRGRIGDAGPVGPPGPPGPPGPPSAGFDFSFLPQPPQEKAHDGGRY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises a method for diagnosing colon cancer in an individual, the method involves obtaining a serum sample from the individual and detecting the presence of either TIMBLO R Regi-alpha and an additional colorectal cancer-associated marker. The method of the invention is useful for diagnosing colon cancer in an individual. The present amino acid sequence represents a human colorectal cancer-
